# READING COMPREHENSION

**TIME: APPROXIMATELY 55 MINUTES (50 QUESTIONS)**  
**NOW SET YOUR CLOCK FOR 55 MINUTES**

In this section you will read several passages. Each one is followed by several questions about it. For this section, you are to choose the one best answer, (A), (B), (C), or (D), to each question. Then, on your answer sheet, find the number of the question and fill in the space that corresponds to the Letter of the answer you have chosen.

**Now begin work on the questions.**

**Questions 1 – 10**

- Line Do you know what leads you to feel stress? Odds are that at least one cause (and probably more than one) entered your mind. But if I were to ask you about the stress that the people in your social world feel, would it occur to you as a factor in your own stress? Perhaps it would, depending on your circumstances.
- (5) But probably not. And yet, this is exactly what a group of researchers decided to investigate. They cited research that stress is conveyed between two people or among a more limited group of folks.

In this longitudinal study, they tracked the stress of a large group of graduate students over the course of six months. The investigators measured various aspects of people's lives, including their degree of stress along with three different personality attributes. Specifically, they asked about people's neuroticism (a tendency to feel more upset and have more fluctuations in how they feel), their conscientiousness (an inclination to engage in self-control and careful consideration, and to think ahead and come up with solutions to problems), and their locus of control (how much someone views themselves or events around them as determining the result of a situation).

The researchers found that the stress an individual experienced was connected to the extent of stress in their social world, and that certain factors appeared to play a role. First, they found that a person's stress was more apt to fall in line with the stress of those in their social sphere when the stress among the people in that sphere was comparable (as opposed to more diverse). Second, they found that there was a weaker tie between a person's stress and the magnitude of stress in their social life if that person had a less neuroticism, more conscientiousness, and an internal locus of control.

(25) Although the research team noted that it's not entirely clear why the stress in a person's social world is linked to their own stress, they highlighted two possibilities. One is that humans tend to draw from others' reactions to try to grasp a situation better. Another is that we tend to observe how other people are responding to help us calibrate the most suitable way of reacting so we can socially fit in. As the researchers rightly pointed out, the study merits being repeated to understand whether the results apply to different groups of people, such as individuals who are older (the average age in this study was 28).

- Despite the lingering questions this study couldn't address, the researchers noted that people who feel more stress are likely to connect with others who
- (35) have the same stress level, and then they feel more stress as they socially engage with those who are also feeling a lot of stress. Accordingly, the research team mentioned the potential value of future programs that could help people learn new coping strategies to reduce the odds of stress being transferred, as well as programs that could enable people with different stress levels to connect.

## Questions 11 – 20

Line The next few decades will see great changes in the way energy is supplied and used. In some major oil producing nations, 'peak oil' has already been reached, and there are increasing fears of global warming. Consequently, many countries are focusing on the switch to a low carbon economy. This transition (5) will lead to major changes in the supply and use of electricity. Firstly, there will be an increase in overall demand, as consumers switch from oil and gas to electricity to power their homes and vehicles. Secondly, there will be an increase in power generation, not only in terms of how much is generated, but also how it is generated, as there is growing electricity generation from (10) renewable sources. There is also likely more electricity generation centres, as households and communities take up the opportunity to install photovoltaic cells and small scale wind turbines. To meet these challenges, countries are investing in Smart Grid technology. This system aims to provide the electricity industry with a better understanding of power generation and demand, and to (15) use this information to create a more efficient power network.

Smart Grid technology basically involves the application of a computer system to the electricity network thus it will pitch in reducing operational and maintenance costs. Smart Grid technology offers benefits to the consumer too. They will be able to collect real-time information on their energy use for each (20) appliance. Varying tariffs throughout the day will give customers the incentive to use appliances at times when supply greatly exceeds demand, leading to great reductions in bills. For example, they may use their washing machines at night. Smart meters can also be connected to the internet or telephone system, allowing customers to switch appliances on or off remotely. Furthermore, if (25) houses are fitted with the apparatus to generate their own power, appliances can be set to run directly from the on-site power source, and any excess can be sold to the grid.

With these changes comes a range of challenges. The first involves managing the supply and demand. Sources of renewable energy, such as wind, (30) wave and solar, are notoriously unpredictable, and nuclear power, which is also set to increase as nations switch to alternative energy sources, is inflexible. With oil and gas, it is relatively simple to increase the supply of energy to match the increasing demand during peak times of the day or year. With alternative sources, this is far more difficult, and may lead to blackouts or system collapse. (35) Potential solutions include investigating new and efficient ways to store energy and encouraging consumers to use electricity at off-peak times.

A second problem is the fact that many renewable power generation sources are located in remote areas, such as windy uplands and coastal regions, where there is currently a lack of electrical infrastructure. New infrastructures (40) therefore must be built. Thankfully, with improved smart technology, this can be done more efficiently by reducing the reinforcement or construction costs.

Although Smart Technology is still in its infancy, pilot schemes to promote and test it are already underway. Consumers are currently testing the new smart meters which can be used in their homes to manage electricity use. (45) There are also a number of demonstrations being planned to show how the smart technology could practically work, and trials are in place to test the new electrical infrastructure. It is likely that technology will be added in 'layers', starting with 'quick win' methods which will provide initial carbon savings, to be followed by more advanced systems at a later date. Cities are prime candidates (50) for investment into smart energy, due to the high population density and high energy use. It is here where Smart Technology is likely to be promoted first, utilising a range of sustainable power sources, transport solutions and an infrastructure for charging electrically powered vehicles. The infrastructure is already changing fast. By the year 2050, changes in the energy supply will have (55) transformed our homes, our roads and our behaviour.

### Questions 21 – 30

Line      Bicycles have been around since the early part of the nineteenth century.

In 1817 Karl Von Drais invented a walking machine to get around the royal gardens faster. Made entirely of wood, the rider straddled two same-sized, in-line wheels, steering with the front wheel and locomoting by pushing against  
(5) the ground. This steerable hobby horse, which could surpass runners and horse-drawn carriages, never became a viable transportation option because of the need for smooth pathways, which were rare at that time.

A second major effort at self-propelled transportation came when Pierre Michaux invented in 1861 the velocipede ("fast foot") that applied pedals directly to the front wheel. To achieve greater speed with every pedal revolution, (10) designers tried larger and larger front wheels, with some reaching almost two meters in diameter. Despite garnering interest from hobbyists, the velocipede had three major deficiencies as transportation: First, lacking gears, it was difficult to climb even a modest grade; second, because the construction was entirely of  
(15) wood, with metal tires coming slightly later, the cobblestone roads of the day made for an extremely uncomfortable ride; third, the big front wheel created problems.

A fresh start and the true beginning of bicycles becoming a popular means of transportation can be traced to around 1886 and the efforts of John Kemp Starley and William Sutton. With equal-sized wheels, tubular steel diamond-shaped frame geometry, and a chain-and-sprocket chain drive to the rear (20) wheel, the "safety bike" looked much like the modern version. During the late 1890s, bicycles were the worldwide focus of invention and technical innovation, much as biotech engineering and computers are today. We owe many of today's  
(25) industrial manufacturing processes, designs for bearings, axles, and gearing mechanisms, and the knowledge of lightweight structures, to the explosion of inventions that bicycles produced.

In the United States, England, and other major nations, patents were awarded at the rate of about 5,000 per year per nation. In one peak year, bicycle-  
(30) related patents comprised close to one-third of all patent-writing activity. Many of these patents were decades ahead of the technology to manufacture them; for example, suspension systems invented a century ago became viable only with modern-day elastic materials and manufacturing technology.

- The two most important single inventions of this long-ago era were
- (35) Starley's tension-spoked wheel and John Dunlop's pneumatic tire. The tension-spoked wheel was and is a marvel of lightweight structures; it allows four ounces of spokes, on a wheel weighing a total of three or four pounds, to support a 200-pound rider meanwhile today's carbon fiber wheels have yet to show a clear advantage over the wheel made from humble carbon steel spokes.
  - (40) The pneumatic tire, which Dunlop invented in 1888, vastly improved the bike's comfort, and it also shielded the lightweight working mechanisms from excess vibration and fatigue. The coaster brake appeared in 1889, and it has been a staple of children's bikes ever since.

Because a bicycle uses a low-power engine (the rider) and because that

- (45) rider can only apply power only over a small rpm range, gearing is essential to match the rider's output to the riding conditions. The first patent for bicycle gears was granted in France in 1868; the rider pedaled forward for one gear and backward for the other gear. An 1869 patent by France's Barberon and Meunier foresaw today's derailleurs. It described a mechanism that would shift a belt
- (50) or chain sideways among three sprockets or discs. That same year, Barberon and Meunier also patented a primitive gear hub. These technical innovations dramatically improved performance. Bicycles of that era were hand-made in cottage industries, and were highly sought after and expensive.

### Questions 31 – 40

Line Humans are uniquely smart among all the other species on the planet.

We are capable of outstanding feats of technology and engineering. Then why are we so prone to making mistakes? And why do we tend to make the same ones time and time again? When Primate Psychologist Laurie Santos from the

(5) Comparative Cognition Lab at Yale University posed this question to her team, they were thinking in particular of the errors of judgement which led to the recent collapse of the financial markets. Santos came to two possible answers to this question. Either humans have designed environments which are too complex for us to fully understand, or we are biologically prone to making bad decisions.

In order to test these theories, the team selected a group of Brown Capuchin monkeys. Monkeys were selected for the test because, as distant relatives of humans, they are intelligent and have the capacity to learn. However, they are not influenced by any of the technological or cultural environments which (15) affect human decision-making. The team wanted to test whether the capuchin monkeys, when put into similar situations as humans, would make the same mistakes.

Of particular interest to the scientists was whether monkeys would make the same mistakes when making financial decisions. In order to find out, they (20) had to introduce the monkeys to money. The team distributed metal discs to the monkeys, and taught them that the discs could be exchanged with team-members for food. The monkeys soon cottoned on, and as well as learning simple exchange techniques, were soon able to distinguish 'bargains' – If one team-member offered two grapes in exchange for a metal disc and another (25) team-member offered one grape, the monkeys chose the two-grape option. Interestingly, when the data about the monkey's purchasing strategies was compared with economist's data on human behaviour, there was a perfect match.

So, after establishing that the monkey market was operating effectively,

- (30) the team decided to introduce some problems which humans generally get wrong. One of these issues is risk-taking. Imagine that someone gave you \$1000. In addition to this \$1000, you can receive either A) an additional \$500 or B) someone tosses a coin and if it lands 'heads' you receive an additional \$1000, but if it lands 'tails' you receive no more money. Of these options, most people  
(35) tend to choose option A. They prefer guaranteed earnings, rather than running the risk of receiving nothing. Now imagine a second situation in which you are given \$2000. Now, you can choose to either A) lose \$500, leaving you with a total of \$1500, or B) toss a coin; if it lands 'heads' you lose nothing, but if it lands 'tails' you lose \$1000, leaving you with only \$1000. Interestingly, when we stand  
(40) to lose money, we tend to choose the riskier choice, option B. And as we know from the experience of financial investors and gamblers, it is unwise to take risks when we are on a losing streak.

So, would the monkeys make the same basic error of judgement? The team put them to the test by giving them similar options. In the first test, monkeys  
(45) had the option of exchanging their disc for one grape and receiving one bonus grape, or exchanging the disc for one grape and sometimes receiving two bonus grapes and sometimes receiving no bonus. It turned out that monkeys, like humans, chose the less risky option in times of plenty. Then the experiment was reversed. Monkeys were offered three grapes, but in option A were only  
(50) actually given two grapes. In option B, they had a fifty-fifty chance of receiving all three grapes or one grape only. The results were that monkeys, like humans, take more risks in times of loss.

The implications of this experiment are that because monkeys make the same irrational judgements that humans do, maybe human error is not a result of  
(55) the complexity of our financial institutions, but is imbedded in our evolutionary history. If this is the case, our errors of judgement will be very difficult to overcome. On a more optimistic note, however, humans are fully capable of overcoming limitations once we have identified them. By recognising them, we can design technologies which will help us to make better choices in future.

### Questions 41 – 50

Line Robert Capa is a name that has for many years been synonymous with war photography. Born in Hungary in 1913 as Friedmann Endre Ernő, Capa was forced to leave his native country after his involvement in anti government protests. Capa had originally wanted to become a writer, but after his arrival in (5) Berlin had first found work as a photographer. He later left Germany and moved to France due to the rise in Nazism. He tried to find work as a freelance journalist and it was here that he changed his name to Robert Capa, mainly because he thought it would sound more American.

In 1936, after the breakout of the Spanish Civil war, Capa went to Spain (10) and it was here over the next three years that he built his reputation as a war photographer. It was here too in 1936 that he took one of his most famous pictures, *The Death of a Loyalist Soldier*. One of Capa's most famous quotes was 'If your pictures aren't good enough, you're not close enough.' And he took his attitude of getting close to the action to an extreme. His photograph, *The (15) Death of a Loyalist Soldier* is a prime example of this as Capa captures the very moment the soldier falls. However, many have questioned the authenticity of this photograph, claiming that it was staged.

When World War II broke out, Capa was in New York, but he was soon back in Europe covering the war for Life magazine. Some of his most famous work (20) was created on 6th June 1944 when he swam ashore with the first assault on Omaha Beach in the D-Day invasion of Normandy. Capa, armed only with two cameras, took more than one hundred photographs in the first hour of the landing, but a mistake in the darkroom during the drying of the film destroyed all but eight frames. It was the images from these frames however that inspired (25) the visual style of Steven Spielberg's Oscar winning movie 'Saving Private Ryan'. When Life magazine published the photographs, they professed that they were slightly out of focus, and Capa later used this as the title of his autobiographical account of the war.

- In 1947 Capa was among a group of photojournalists who founded Magnum Photos. This was a co-operative organisation set up to support photographers and help them to retain ownership of the copyright to their work. Capa went on to document many other wars. He never attempted to glamorise war though, but to record the horror. He once said, "The desire of any war photographer is to be put out of business." Capa died as he had lived. After promising not to photograph any more wars, he accepted an assignment to go to Indochina to cover the first Indochina war. On May 25th 1954 Capa was accompanying a French regiment when he left his jeep to take some photographs of the advance and stepped on a land mine. He was taken to a nearby hospital, still clutching his camera, but was pronounced dead on arrival. He left behind him a testament to the horrors of war and a standard for photojournalism that few others have been able to reach.

Capa's legacy has lived on though and in 1966 his brother Cornell founded the International Fund for Concerned Photography in his honor. There is also a Robert Capa Gold Medal, which is given to the photographer who publishes the best photographic reporting from abroad with evidence of exceptional courage. But perhaps his greatest legacy of all are the haunting images of the human struggles that he captured.

Good day, everyone, and welcome to our regular program on health issues. Today, we are going to talk about the main source of our energy: eating. Do you enjoy eating? Are you careful about what you eat or do you eat what you enjoy?

Nowadays, it's easy to find food with different appearances which makes it more appealing. In one way, it is good for the food industry for they can be creative in making food, but how we should see this phenomenon in terms of health issues? The easiest yet hardest answer to that is to balance your eating. By eating the right amount of calories that your body needs and eating a wide range of foods, your body will still receive all the nutrients it needs.

Here is the list of types of foods according to their calorie concentration.

Use details and examples in your response.

## QUESTION 4

### DIRECTIONS

Listen to a conversation between two students. As you listen, think about what problem are they discussing. What are the two solutions they talk about?

**M** : Hey, Lisa! It's been a while since I saw you.

**W** : Hi to you too, Mike. Well, I'm always on the campus. It is you I never seen in the last three months.

**M** : Now, now, don't judge me. I'm here to be a full-time student again starting next semester.

**W** : Well, I guess everyone has their own reasons.

**M** : Thank you for being considerate. But enough of that—I'm here to ask your opinion.

**W** : What is it?

**M** : Well, I want to ask your opinion about classes. You know, what kind of class I should take to boost my credits and such? I know I can trust your opinion about this kind of thing.

**W** : Oh, right. You don't know about the new rule.

**M** : What rule?

**W** : The campus' new rule. We have academic advisors to guide the students into taking courses according to their level. I mean, you know sometimes there are students who take an advance-level class when they should have taken the lower-level class first? Apparently, the campus received lots of complaints about that from the teachers, so this is their solution.

**M** : Really? But I remember there are students who take the advanced-level and the lower-level class in one semester.

**W** : That's exactly the problem. Lots of those students ended up getting bad scores in either one of those classes or both, so they had to retake the class. This leads to lots of students unable to graduate on time and the campus doesn't want this habit to continue.

**M** : Oh, too bad. I really want to take History II for the next semester.

**W** : But you have to take History I first.

**M** : I did enroll in the class last semester.

**W** : Yeah, but you know you didn't really finish it, right? You missed the last assignments for the last three months.

**M** : Well, I can just try to enroll in the class.

**W** : The thing is we are not allowed to register for a class without the advisor's approval and the advisor will ask Mr. Smith first. Besides, Mr. Smith will be the teacher for History II this semester. You'll only waste your time.

Now, talk about what the student should do. In your response, briefly describe the problem. Talk about which solution you prefer and explain why.

What should the man do? In your response, briefly describe the problem. Talk about which solution you prefer and explain why.

## PART B

**Questions 31 – 35: Listen to a conversation between a man and a woman.**

- M** : Excuse me. Could you tell me what the Homestay Program in the brochure is?  
**W** : The Homestay Program is designed to promote friendship and language learning. We try to provide the opportunity for cultural exchange between local and international students who attend the university. Local people open their homes to students so that they may experience an exchange of friendship across cultures. Many friendships that last a lifetime have developed from these stays.  
**M** : I see. What kind of families do you choose for the hosts?  
**W** : All kinds of families participate in this Homestay Program. There are single people with or without children, as well as couples with or without children.

**M** : Do the hosts know this program well?

**W** : Yes. The homestay coordinator has visited each family and provided information on the program and explained the responsibilities of the host. They look for people who are kind and friendly and enjoy meeting students from other countries. They make sure the hosts understand that this program is not designed for their financial gain.

**M** : It sounds good. Is there anything that the student should be aware of?

**W** : The student must be willing to communicate with the hosts to establish a good relationship with them. Communication will require patience and effort because cultural and language differences sometimes create misunderstandings and confusion. So, you must be willing to interact and understand the bigger picture.

**M** : That's great. I think it is expected since I, for one, need guidance in understanding things regarding this country. I would be happy to find people whom I can ask about schools and the culture of this country.

**W** : That's good. I think the programme suits you.

**M** : I would like to apply for it, Miss...?

**W** : Hayes, please.

**M** : Miss Hayes. I'm Austin Park from Korea.

**W** : Nice to meet you, Mr. Park. You can go to the Homestay Office to fill in some forms. I hope your experience will be a positive one.

31. How did the student know about the Homestay Program?

32. What is the purpose of the Homestay Program?

33. What can we imply about the hosts of the Homestay Program?

34. What does the student think about the program?

35. What will the student do after the conversation?

#### **Questions 36 – 40: Listen to a phone conversation between a man and a woman.**

**M** : Hi, Susan. How are you getting on with your English studies?

**W** : It's hard. I have been in England for a year, but when people talk, I keep going blank and can't register what they say.

**M** : Don't worry. You have to be patient and practice English more.

**W** : It's very strange, you know, my son, Eric, is only four, but he seems to learn English much more quickly than I do. Why is it easy for young children to learn a language?

**M** : I think part of the answer is that children are learning new things all the time. Their brains are still developing, so it makes their brains more flexible for learning.

**W** : I agree with you. We, adults, need to learn new things as well, especially when we settle in a foreign country. But it takes us a long time to get used to a new life than young children.

M : Yes. Another part of the answer is that older people are more fixed in their ways of living. It is not easy for adults to change from one language to another because we have been hearing and talking in one language for a long time. However, children are not used to that.

W : Yeah. A child's mind is free in his ways. He is free to hear sounds as they are and make them as he hears them. He is free to put new words together and speaks a new language.

M : I think that is why they learn things so fast. They are more focused and have less expectation of what they should be heard.

W : That's true. I have had this kind of problem months ago. I was asking the way to the station to someone, and I couldn't recognize the difference between "light" and "right." I thought I was supposed to go right when I should turn at the light. It took me two hours to get to the station.

M : I'm sorry to hear that. You know, practice makes everything perfect. You can try to talk with others who use the language well. Also, it takes time to learn a language as an adult. Don't beat yourself up for past mistakes.

W : Thank you. I will take that in mind.

36. What aspect of English does the woman find it hard to understand?

37. What makes children easy to learn languages?

38. What makes adults need time to learn languages?

39. Why did the woman take hours to get to a station?

40. What solution does the man suggest for the woman?

## PART C

### Question 41 – 45: Listen to a lecture delivered by a man.

The discovery of the planet Neptune was one of the highest points in the development of gravitational theory. You might remember that most people before this time believed in the geocentric view of the Earth. That is the Earth was the center of the universe and the Sun, the Moon, and other planets revolve around it. And it was Copernicus who first proposed the heliocentric theory that the Earth and the other planet in the solar system revolve around the sun. Still, it took a couple of hundred years for scientists and researchers to change their view and admit that the heliocentric theory was and is indeed accurate.

At that time, Copernicus could not explain the reason why and how the planets revolve around the Sun, thus making the geocentric theory had been accepted for over a thousand years. Now, this is where the hero of the story of the heliocentric theory, gravity, comes into play. The motion of the planet has to be explained through some type of mechanism, and that turns out to be gravity. It's the gravitational pull that eventually helps astronomers understand how the planets revolve around the Sun. And that leads us to the discovery of Neptune.

So, in the decade following its discovery, the orbit of Uranus had been calculated. But there was a problem. Uranus did not move in the orbit predicted by the theory of gravitational pull. By 1814, over 50 years after it was called a planet, it was clear that Uranus did not move in orbit according to the one predicted by the gravitational theory. In 1843, John Couch Adams, a young English man, began a detailed mathematical analysis of the motion of the Uranus to see whether they might be produced by the pull of an unknown planet. He guessed that there must be a planet more distant from the sun than Uranus and then determined the mass and the orbit it had to have to count Uranus' strange orbit. About a month later, an astronomer in Germany started to look for the planet. He quickly found and identified it. It was less than a degree from the position predicted by Adams. The discovery of this faraway planet, Neptune, was a major triumph for gravitational theory. Because it's dramatically confirmed its laws with a great deal of accuracy.

This discovery was a major step forward in combining gravitational theory with careful observation. Such work continues in our time with the discovery of planets around other stars.

#### **Question 46 – 50: Listen to a lecture delivered by a man.**

Modern scholars are obsessed with analyzing primary sources of cultures from the ancient world, and that comes with good reason, especially when studying ancient Greeks history. It's kind of like trying to put together a puzzle where most of the pieces are missing.

The most common sources for Greek history fall within two categories: literary works, which include fiction and nonfiction, and archaeological finds.

Homer's epics are considered essential reading for most students. From a historian's perspective, however, they are quite a headache to interpret. You see, the stories of the *Iliad* and *Odyssey* were originally oral tales, told through word of mouth rather than written on paper. The events they describe occurred well before they were finally written down by Homer in the 6th century BC. These works most likely do not reflect the society of any particular Greek city-state at any one period, but rather a mixture of places and times. Their value for historians, as a result, rests more on their impact on later Greek culture, rather than on providing information about the time that is written about.

Herodotus mostly described the history of Athens, and from the way he writes it's clear that he is Athenian and very much concerned with making his culture appear dominant, so it's hard to rely completely on his book Histories, which describes the Persian War. Besides Homer and Herodotus, we also have the famous philosophies of Plato and Aristotle. Now, even though all of these texts come from different fields, particularly literature, history, and philosophy, we must still be cautious. Besides believing in the superiority of their own culture, the authors of these sources were men and provide very little evidence of the lives and perspectives of women in the Greek world, except as seen through the eyes of men. Secondly, most of the authors were wealthy individuals; thus, their perspective does not reflect that of most citizens and slaves.

Besides literary sources, there is also, thankfully, archaeological evidence that we can examine and, fill in the gaps, so to speak, from the literature. Archaeological sources provide us with key information about different aspects of everyday life in different city-states. For example, in one famous Greek city, archaeologists found that each citizen was given an equal piece of land. Imagine, every single person in a city having an equal amount of space. This one simple find shows that the Greeks were interested in city planning and the inequality of citizens.

So, my point is that by combining literary and archaeological sources, historians can complete much more of the puzzle than would have been possible with just the literature. Still, significant gaps in our knowledge about ancient Greeks remain. But that's one of the joys of studying ancient history, we get to play the part of a detective, attempting to reconstruct the history of events based on just a few available clues.

46. What is the lecture mainly about?
47. What makes *Iliad* and *Odyssey* not ideal for learning about ancient Greeks?
48. What problem does the professor mention with literary sources of ancient Greeks?
49. Why does the professor mention archeology?
50. What is the professor's opinion on studying ancient history?

sosial mereka ketika stress di antara orang-orang di lingkungan itu sebanding." Kalimat tersebut dapat menjadi panduan untuk memilih jawaban yang tepat. Pilihan A dan D tidak tepat, karena dalam paragraf tersebut memang disebutkan bahwa stress pada seseorang berhubungan dengan lingkungan sosial mereka dan tingkatnya sebanding dengan satu sama lain. Pilihan B tidak tepat, karena memang disebutkan adanya atribut kepribadian yang mempengaruhi stres. Jadi, jawaban yang tepat adalah C "*Social sphere has no impact to someone's stress.*"

**Kata Kunci** : *This experiment implies that because monkeys make the same irrational judgments that humans do, maybe the human error is not a*

*result of the complexity of our financial institutions, but is embedded in our evolutionary history*

**Pembahasan:** Pilihan A tidak tepat, karena dalam paragraf terakhir disebutkan ditemukan bahwa monyet membuat penilaian irasional yang sama seperti manusia (*The implications of this experiment are that because monkeys make the same irrational judgements that humans do*). Pilihan B tidak tepat, karena tidak disebutkan tentang mengatasi keterbatasan untuk memahami hewan. Pilihan D tidak tepat, karena tidak disebutkan tentang rencana melakukan percobaan tersebut dengan teknologi terbaru. Pilihan C terdapat dalam, "*maybe human error is not a result of the complexity of our financial institutions, but is imbedded in our evolutionary history*" (mungkin kesalahan manusia bukanlah hasil dari kerumitan lembaga keuangan kita, tapi tertanam dalam sejarah evolusi kita). ## QUESTION 2

### Jawab:

I prefer to study for exams by myself. When I study in my room alone, I can focus entirely on what I need to learn. I can review my notes on subjects that I'm lacking and find better ways to study. When studying in a group, I can't focus on my own weak spots. For example, there was one time when everyone agreed to study Biology because it was the first subject to be tested when I personally needed to study Chemistry more often because I was lacking in that subject. I also tend to be distracted when I study in a group. I remember last year I was preparing for the midterm exam with my classmates but we ended up chatting a lot about a new popular series on a streaming platform instead of studying. I got a bad grade because of that and I learned to study by myself ever since.

### QUESTION 3

**Jawab:**

I think it's because having a solid book in our hands is different than an electronic one. For some people, their first experience in reading is very much reading a physical book since electronic books have still considered a new habit for the last 10 years. By holding a solid book, we can feel the texture of the paper, listen to the crisp sound of turning its pages, also smell the fresh paper scent. We can't get that feeling by reading an electronic book. A physical book can be an anchor to some people as it can be used as a reminder to rest and take things slowly. Besides, having physical books also can serve as a room decorator. People can arrange their physical books based on their color or height as a form of therapy. That's why some people would much rather read a book they can hold.

### QUESTION 4

**Jawab:**

According to the recording, it is mandatory for the students to consult with the academic advisors before they take courses for the next semester. There are lots of students who failed to graduate on time because they took the wrong courses and the campus wants to minimize that. Yet, the man wants to take History II when in fact, he didn't finish History I. I think the man should consult with an academic advisor before he decides what classes to take. Based on the woman's explanation, the teacher for History II will be the same as History I, so there is a chance that the teacher will remember that the man didn't finish his class last semester. Moreover, there is no guarantee that man can follow the materials of History II without a proper understanding of History I. I think he should not waste time by guessing and should consult an academic advisor.
